

ABA:1982

OB anterior

The image displays a brain scan with two distinct blue-colored lobes, likely representing areas of activation or a specific anatomical region. These lobes are positioned symmetrically on either side of a central vertical white line, which serves as a midline. A horizontal white line intersects the vertical one, creating a crosshair that divides the image into four quadrants. The lobes are situated in the lower-middle portion of the image, spanning across the vertical midline. The background is solid black, providing high contrast for the blue lobes and the white lines.
