OB anterior

The image displays a top-down view of a brain scan, likely a PET or SPECT scan, showing two distinct blue-colored regions of activity. These regions are positioned symmetrically on either side of a central vertical axis, resembling the hemispheres of a brain. A small, isolated blue spot is visible just below the central gap between the two main lobes. The entire scan is set against a black background and is overlaid with a white crosshair consisting of a vertical and a horizontal line that intersect at the center of the brain's representation.
