Hb

This fluorescence microscopy image displays a cross-section of a plant root. The image is characterized by a bright blue signal, which represents the localization of Hb (likely a fluorescently tagged protein). The signal is distributed throughout the tissue, with a prominent, elongated, and slightly curved structure in the center-left quadrant. The entire image is overlaid with a white crosshair, consisting of a vertical and a horizontal line that intersect at the center. The background is black, providing high contrast for the blue signal.
