MD

This is a coronal brain MRI scan. The image shows a cross-section of the brain with a central, hyperintense (bright) lesion located in the midline, likely involving the corpus callosum and surrounding white matter. The lesion is surrounded by a larger area of lower intensity, possibly representing edema or a different tissue component. The brain's gyri and sulci are visible on either side of the central structure. A white crosshair is overlaid on the image, with the vertical line passing through the center of the lesion and the horizontal line passing through the middle of the brain slice.
