A posterior

This is an axial PET scan of the brain. The image shows a cross-section of the brain with a color scale where blue represents low activity and red/yellow represents high activity. Two prominent, elongated areas of high activity are visible in the posterior region, symmetrically located on either side of the midline, corresponding to the posterior cingulate cortex. The rest of the brain shows relatively low activity, represented by blue. A white crosshair is overlaid on the image, with the vertical line passing through the center and the horizontal line passing through the level of the posterior cingulate activation.
