This image is a coronal PET scan of a human brain. The brain is shown in a cross-section, with the left side of the image representing the patient's right hemisphere and the right side representing the left hemisphere. A prominent, bright yellow and red focal area of high radiotracer uptake is visible in the left striatum, indicating a potential site of abnormal metabolic activity. The rest of the brain shows a more uniform, lower-level blue and green signal. A white crosshair is overlaid on the image, with the vertical line passing through the center of the brain and the horizontal line passing through the level of the focal uptake.
