IC

The image displays a coronal cross-section of a human brain. A large, irregularly shaped region is highlighted in a solid blue color, representing a specific anatomical area or a statistical parametric map. Within this blue region, in the lower posterior part (inferior cerebellum), there is a small, distinct cluster of activation. This cluster is represented by a color gradient: a central yellow/orange core surrounded by a blue halo, indicating a localized area of higher intensity or statistical significance. The entire brain image is overlaid with a white grid consisting of a horizontal line and two vertical lines.
