This is an axial PET scan of a human brain. The image shows a cross-section of the brain with a color scale from blue (low activity) to yellow (high activity). A small, bright yellow spot is visible in the left hemisphere, indicating a focal area of increased metabolic activity. The rest of the brain shows a more uniform, lower level of activity represented by blue and light blue colors. A white crosshair is overlaid on the image, with the vertical line passing through the center of the brain and the horizontal line passing through the level of the focal activity.
