Hb

This fluorescence microscopy image displays a cross-section of a plant leaf, likely from a legume, stained to visualize the localization of a specific protein, Hb. The leaf is divided into four quadrants by a central vertical line and a horizontal line. The left half of the leaf shows a distinct pattern of fluorescence, with a bright yellow-green spot near the top edge and several smaller, dimmer spots along the central vein and lower edge. The right half of the leaf shows a uniform, low-level blue fluorescence across the entire area. The overall shape of the leaf is roughly oval with a slightly notched bottom edge.
