SPa dorsal

This is a coronal brain scan image, likely a PET or SPECT scan, showing a cross-section of the brain. The image is predominantly blue, indicating low signal intensity. A prominent, bright yellow-green spot is visible on the midline, just above the brainstem, which is characteristic of a pineal gland lesion or a specific tracer uptake. The brain's symmetrical structure is visible, with the hemispheres separated by the midline. A white crosshair is overlaid on the image, with the vertical line passing through the center of the brain and the horizontal line passing through the level of the bright spot.
